

## **tpbaysproxy**

The Pirate Bay used to host customary torrent files, the site now offers magnet links only. These links are hyperlinks with all the necessary information required by torrent clients, such as qBittorrent, uTorrent, Deluge and Transmission to be able to download files from the P-2-P site without requiring a third-party application.

Since torrent files are fully unencrypted, it is very easy for your ISP to monitor your downloads and uploads. Furthermore, it is not possible for you to know whether the peers you are connecting to on the site have bad intentions.

Therefore, if you want to download your favorite torrent files from a peer-to-peer site like TPB anonymously, you have to use a paid VPN. You also have to make sure that the VPN you choose doesn't log your activities. Don't forget that not every VPN supports P2P traffic and downloading of torrents. Some of the most reliable VPNs that support The Pirate Bay include CyberGhost, IPVanish, Windscribe and NordVPN. [piratebay](#)
